Complete TeX and numerical source package

23 September 2026

This package contains the complete 32-page clean article, full blue/red comparison, rebuttal, exact source diff, numerical reproduction report, baseline, and all compilation inputs.

Compile all documents

A full TeX Live or MiKTeX installation with pdfLaTeX, BibTeX, and latexmk is required. Compilation uses only package-local inputs and does not require scientific Python packages or network access.

```
python3 build.py --force
```

The eight document targets are `clean`, `marked`, `rebuttal`, `changes`, `notes`, `guide`, `baseline`, and `reproduction`. Output PDFs and logs are written to `build/`. For example:

```
python3 build.py --document clean --force
```

For Overleaf, upload the ZIP and choose `main_revised_23092026_norebutal.tex` or `main_revised_23092026_tracked.tex` as the main document, using pdfLaTeX. The unchanged baseline is compiled through `original_baseline_compile.tex`, which supplies compilation adapters without editing its original source.

Recompute the main experiments

```
python -m pip install -r requirements-reproduction.txt
python code/run_polynomial_experiments.py
python code/refit_selected_kernel.py
python code/plot_verified_experiments.py
```

These commands reproduce the two-dimensional polynomial fits, the three-dimensional anchored kernel fits, seven native figures, and two TeX tables. Training and testing arrays, fitted coefficients, all candidate scores, seeds, solver statuses, and derivative checks are in `results/accuracy/`. No analytic reference values enter fitting or model selection.

Recompute the additional comparisons

```
python code/run_experiments.py
python code/make_tables.py
python code/generate_figures.py
```

The appendix contains 36 method/seed records, including the structured eight-dimensional example. The code also measures timings and dense Gram costs. Timings vary with the machine.

Replot from saved arrays and verify vector output

```
python code/generate_figures.py
python code/plot_verified_experiments.py
python code/check_vector_pdfs.py
python build.py --force
```

The figures consist of vector paths and embedded fonts. No PNG is wrapped, traced, or embedded into the clean article. The saved data allow replotting without refitting.

All TeX sources

The root contains the eight document masters, the unchanged baseline source, and the tracked bibliography fragment. The `results/` directory contains five table fragments: the three appendix tables and the two verified main-text tables. All bibliography files and the clean bibliography fallback are included. The machine-readable inventory `verification/tex_source_inventory.json` lists every TeX file.

Comparison archive and audit

The original 28-page source, original PNGs, and recovered scripts are preserved. The blue/red manuscript and `changes_from_requested_baseline.diff` expose all changes. The separate reproduction report records the original-source replays and explains the stabilized implementations. Historical replay scripts write to `results/reproduction/`; their diagnostic plotter writes to `figures/audit/` so it cannot overwrite the clean article's figures. `MANIFEST.sha256` identifies the delivered inputs.
